

# Version 5.28.00 Binary Build Configurations

- [build configuration](#) [1]

This page shows how the binary ROOT distributions were build for the different platforms.

You can use `root-config --config` to see all options passed to `./configure`. In addition you can use `root-config --features` to see all supported features of the specific ROOT install. The feature list is a combination of the explicit features specified via `./configure` arguments, the features specified via environment variables and those found via auto-detection.
